HAWASSSA UNIVERSITY

MOBILE APPLICATION DEVELOPMENT

GROUP PROJECT

Project Proposal-Med-Tracker ET.

Med-Tracker: Your digital bridge to do better medical management.

Problem Statement

In Ethiopia, patient health information is often fragmented. Individuals frequently lose paper prescriptions, forget vaccination schedules for their children, and struggle to recall their medical history when visiting a new clinic. This lack of a centralized, personal health record leads to repeated tests, misdiagnosis, and inefficient use of time for both patients and doctors. Patients with chronic illnesses, such as diabetes or hypertension, are particularly affected as they need to consistently track and share their vitals with healthcare providers.

User Persona

Our primary user is Selam, a 34-year-old mother of two living in Addis Ababa. She struggles to manage her children's vaccination cards and her own prescription history. She visits different health centers for various needs and often forgets to mention critical past diagnoses, making it difficult for doctors to get a complete picture of her family's health.

Proposed Solution

Med Tracker ET is a personal health record (PHR) mobile application that empowers users to take control of their health data. It allows them to securely store, organize, and share their medical information. By digitizing this information, the app ensures that critical health data is never lost and is readily accessible to the user and, with their permission, to their healthcare providers, leading to more informed medical decisions.

Core Features (Minimum Viable Product - MVP)

- User Profile & Authentication: Secure sign-up and login using email or phone number, allowing users to create a personal profile.

- Medical History Log: A centralized repository where users can add and store key medical events, including past diagnoses, allergies, surgeries, and chronic conditions.
- Vaccination & Medication Tracker: A feature to input and track upcoming and past vaccinations (especially for children) and medication schedules (e.g., "Take medication X twice a day for 10 days").
- Vitals & Appointment Log: A simple interface for users to manually log key health metrics (e.g., blood pressure, blood sugar, weight) and schedule reminders for upcoming doctor's appointments.

Team Members & The "Everyone Codes" Roles

BINIAM GELEBO ---------- Database & State Lead

FITSUM DAWIT ---------- Core Logic &Service Lead

FITSUM MOLLA ---------- UX/UI Implementation Lead

KALEAB SHEWADEG ---------- Networking &API Lead

DEGIFE TISE ---------- Devops &Testing Lead

PART 2: GITHUB REPOSITORY SETUP

1. Repository Creation
   - Repository Name: MAD-Project-Med Tracker ET
   - Visibility: Private
2. Invite Collaborator
   - Instructor/Reviewer: Elias Jarso
   - GitHub Username/Email: eliasjars0@hu.edu.et (as provided)
3. Professional README.md (Content)
   - Med Tracker ET
     - Your personal health record, always at your fingertips, ensuring continuity of care.
   - Project Description
     - Med Tracker ET is a mobile application designed to solve the problem of fragmented health records in Ethiopia. It empowers individuals and families to securely manage their medical history, vaccination schedules, and prescriptions in one digital place. By providing a clear record of past health events, the app aims to improve communication between patients and doctors, leading to more efficient and accurate healthcare.

4. Upload Project Proposal

- Create folder /docs and upload Project Proposal.pdf.

5. Add Android .gitignore

- When creating the repository on GitHub, select the Android template from the .gitignore dropdown.

PART 3: FIGMA UI/UX DESIGN (The Visual Blueprint)

1. Low-Fidelity Wireframes (for the 3-5 MVP screens)

Create wireframes (using simple boxes and lines) for the following core screens:

- Screen 1: Login/Signup: Simple forms for email/phone and password, with buttons for login and "Create New Account."
- Screen 2: Home/Dashboard: A central screen with large, clear buttons or cards for the main actions: "Add Medical Record," "View Vaccination Schedule," "Log Vitals."
- Screen 3: Medical History Log: A list view displaying past medical events (e.g., "Diagnosis: Malaria - March 2025").
- Screen 4: Add/Edit Record: A form with fields like "Title" (e.g., "Doctor Visit"), "Date," "Description," and "Attachments" (placeholder icon).
- Screen 5: Profile: A simple screen displaying user information and a list of family members managed by the user.

2. User Flow

User Flow 1 (Login to Adding a Record):

1. User arrives at Login/Signup screen.

2. After successful login, user lands on Home/Dashboard.

3. User clicks the "Add Medical Record" button.

4. User is navigated to the Add/Edit Record form.

5. User fills out the form and clicks "Save," which takes them back to the Medical History Log, where the new entry is now visible.

User Flow 2 (Viewing a Vaccine Schedule):

1. User is on the Home/Dashboard.

2. User clicks the "View Vaccination Schedule" button.
3. User is taken to a screen displaying a list of upcoming vaccinations for themselves or a selected family member.

3. Share the Project

- Set permissions to "Anyone with the link can view" and paste the link into the README.md file on

PART 4: JIRA PROJECT MANAGEMENT (The Work Plan)

1. Create a Jira Project

- Project Type: Scrum
- Project Name: Med Tracker ET Development

2. Invite Instructor

- Go to Project settings and add Elias Jarso as a user using his email: eliasjars0@hu.edu.et.

3. Populate the Backlog with Epics

Create the following Epics, each corresponding to an MVP feature:

- Epic 1: User Authentication
- Epic 2: Medical History Management
- Epic 3: Vaccination & Medication Tracking
- Epic 4: Vitals & Appointment Logging

4. Break Down an Epic into User Stories

Epic: User Authentication

- User Story 1: "As a new user, I want to create an account with my phone number, so that I can securely store my medical records. "
- User Story 2: "As a returning user, I want to log in with my email and password, so that I can access my personal health data. "
- User Story 3: "As a user, I want to edit my profile information, so that I can keep my contact details up-to-date. "

5. Plan Your First Sprint

- Sprint Name: Sprint 1: Project Setup & Design
- Duration: 1 week Tasks from Backlog:

Epic: N/A (Infrastructure)

- Create Project Proposal PDF (Assign to: DevOps & Testing Lead)
- Set up GitHub Repository (Assign to: DevOps & Testing Lead)
- Create low-fidelity wireframes in Figma (Assign to: UI/UX Implementation Lead)
- Create User Flow in Figma (Assign to: UI/UX Implementation Lead)
- Epic: User Authentication
- Draft User Stories for Login/Signup (Assign to: Core Logic & Services Lead) Set up Jira project and Epics (Assign to: DevOps & Testing Lead)

SUBMISSION CHECKLIST

- GitHub: Repo named MAD-Project-Med Tracker ET, eliasjars0@hu.edu.et invited, README.md is complete with links, .gitignore is set to Android, and /docs/Project Proposal.pdf is uploaded.
- GitHub Link.https://github.com/kaleab12/Med-tracker-ET
- Figma: Link in README.md is active and viewable. Contains 5 low-fidelity wireframes and shows a clear user flow (e.g., Login -> Dashboard -> Add Record).
- Figma Link.https://www.figma.com/design/SRwyXY62vchi79UWYdlJc4/Med-Tracker-ET-team-library?node-id=0-1&t=FbSeVqmF18xkP3zB-1

- Jira: Link in README.md is active, eliasjars0@hu.edu.et is invited. Backlog contains Epics for the 4 MVP features. "Sprint 1: Project Setup & Design" is created and populated with tasks assigned to specific team members based on their roles.
- Jira Link.
